

Yamaha SMT PCB Mount Data - Field Documentation

Field	Description
Machine Serial	Unique serial number assigned to the Yamaha SMT machine that processed the PCB. Used to identify the physical machine.
Machine Model	Indicates the model of the SMT machine used for component placement. Different models may have different capabilities and configurations.
Board Name	Name of the PCB design or product being manufactured. It remains the same for all boards of the same design.
Board ID	Unique identifier assigned to each individual PCB. Typically encoded as a QR code and scanned by the Yamaha machine.
Date & Time	Timestamp indicating when the PCB entered the mounting process. Used for production tracking and traceability.
Mount Table	Specifies the mounting table (A, B, C, D) used by the machine. The number of mount tables depends on the machine model.
Block Number	Identifies the specific placement block within the PCB program. The total number of blocks varies depending on the PCB design.
Mount Number	Represents the mounting sequence number but is not required for this project.
Silk Name	Reference designator or name of the component being placed on the PCB. Each block contains a component with its corresponding silk name.
Part Number	Unique part number of the component being mounted. It varies depending on the PCB design and component used.
Head Number	Identifies the placement head that picked and placed the component. Useful for analyzing head utilization and performance.
Feeder Type	Specifies the size or dimension of the feeder tape used to supply the component. Different component sizes require different feeder types.
Set Number	Indicates the slot number in the machine where the feeder reel is installed. Each machine contains multiple feeder slots.
Parts Lot ID	Identifies the manufacturing lot of the components, typically representing the production date or batch. Used for traceability.
Parts ID	Unique identifier assigned to a specific component type. Different components have different Parts IDs.
Reel ID	Unique identifier assigned to each reel of components loaded into the machine. Helps track component consumption and reel usage.
Feeder ID	Unique identifier of the feeder used to hold the component reel. It remains fixed for a particular design, although each feeder has its own unique ID.
